

The GBEP GHG Methodological Framework for Bioenergy

8th GBEP Steering Committee Meeting

Jakarta

18 Nov 2009

Melinda Kimble – UN Foundation

Ben Zaitchik – U.S. Department of State

Co-Chairs GBEP GHG Methodologies Taskforce

Background

- GHG methodologies taskforce established by GBEP steering committee in May 2007.
- Desired end result is flexible methodology for policy makers in all countries.

Taskforce Work Plan

GBEP Steering Committee set forth 5 key elements of taskforce:

1. Review existing methodologies;
2. Develop a harmonised approach so GHG lifecycle assessments can be compared on an equivalent basis;
3. Encompass the full well-to-wheel lifecycle of transport biofuels;
4. Not indicate a preference for any particular existing methodology or feedstock, or to limit parameters; and
5. Define parameters and inputs to be considered when conducting a LCA and develop a good practice document.

Approach

- The taskforce decided to develop a flexible “checklist” framework that could be applied to the LCA of bioenergy production and use.
- Work was based on accepted methods for undertaking environmental lifecycle analysis and GHG inventories, such as the ISO 14040 standards and the IPCC good practice guidance for land use change and forestry.
- Over the course of 16 months and 5 taskforce meetings, the taskforce produced the LCA checklist that is being presented today.

Components of the LCA

1. GHGs covered
2. Source of biomass
3. Land use changes due to bioenergy production
4. Biomass feedstock production on farms and in forests
5. Transport of biomass
6. Processing into fuel
7. By-products and co-products
8. Transport of fuel
9. Fuel Use
10. Comparison with replaced fuel

Components of the LCA

For each component, a set of checklines were developed to allow for complete, transparent, and flexible reporting of greenhouse gas emissions.

Steps 1 & 2: Introductory Information

Step 1: GHGs Covered

CO₂ ____

CH₄ ____

N₂O ____

HFCs ____

PFCs ____

SF₆ ____

Other _____

Please report global warming potential used for each GHG covered.

Step 2: Source of biomass

Non-waste ____

Identify Feedstock: _____

Residue or Other Waste ____

Identify Feedstock: _____

* Please explain definition of waste:

Substance that the holder intended to discard ____

Substance that had zero or negative economic value ____

Substance for which the use was uncertain ____

Substance that was not deliberately produced and not ready for use without further processing ____

Substance that could have adversely affected the environment ____

Other: _____

Step 3: Land Use Change

Step 3: Land use change

Accounting for land use change in a lifecycle framework for estimating emissions for bioenergy is a complicated matter. Many institutions around the world are developing their methodologies. Some account for land use change in a single, holistic assessment while others sub-divide bioenergy-associated land use change into direct and indirect changes. Some further distinguish between indirect land use changes that are domestic versus those that are international. The reporting framework presented below is intended to be flexible in order to clarify which of these multiple approaches is taken by the methodology being described.

- Direct land use changes are taken into account **OR**
 Indirect land use changes are taken into account **OR**
 A combination of both is included

Explain the choice.

Step 3: Land Use Change

3a: Direct Land use Change

Direct land use changes, when they occurred, are accounted for (Y or N). If yes:

.....

3b: Indirect Land use Change

- Domestic indirect land use change is taken into account **OR**
- International indirect land use change is taken into account **OR**
- Both are taken into account separately **OR**
- Both are taken into account without making the distinction

Explain the choice.

Domestic indirect land use changes are accounted for (Y or N). If yes:

.....

International indirect land-use changes are accounted for (Y or N). If yes:

.....

Step 3: Land Use Change

For each type of land use change considered:

1. Identify the reference period or scenario
 - ___ Historic (identify year or period)
 - ___ Business-as-Usual (BAU) scenario (identify time frame: _____)
 - ___ Other (explain)
2. Describe how the methodology attributes this type of land use change to biofuels
3. Explain key reference assumptions and characteristics relevant to estimating GHG emissions from land use change. Examples include:
 - System boundaries (such as sector, activity, and geographic coverage)
 - For BAU scenarios, assumed trends in key variables and land uses
 - Omitted emissions sources
 - Time period over which land use change emissions are allocated
4. Briefly describe the type of land-use changes accounted for (2 – 3 paragraphs).
5. The following impacts of land use change are accounted for:
 - Accounted for net changes of carbon stocks in:
 - ___ living biomass, ___ dead organic matter, ___ soils
 - ___ Changes in carbon stocks in products (such as harvested wood products)

[Depending on choice of methodology and temporal system boundary, the net changes in carbon stock in these carbon pools from land use conversion may be positive (increased carbon stock) or negative (decreased carbon stock). In responding to this question, please indicate the reason for including or disregarding changes in any of the carbon pools.]
6. The methodology and data used are publicly available: Methodology (Y / N), Data (Y / N)

Step 4: Biomass Feedstock Production

Step 4: Biomass feedstock production

Focus on Direct Emissions:

1. Sources of direct GHG emissions and removals are accounted for:

Emissions from operating farm/forestry machinery

Emissions from energy used in irrigation

Emissions from energy used to prepare feedstocks (drying grains, densification of biomass, etc.)

Emissions from energy used in transport of feedstocks

CO₂ emissions from lime/dolomite applications

N₂O emissions resulting from the application of nitrogen fertilizers:

direct; volatilization; runoff/leaching

CH₄ emissions from lands (especially wetlands)

net changes in soil organic carbon (due to cultivation practices, not land use change (step 3.5))

[Depending on choice of methodology and temporal system boundary, the net changes in carbon stock in this carbon pool may be positive or negative. In responding to this question, please indicate the reason for including or disregarding changes in soil organic carbon.]

Other (please specify)

2. For all checked, clarify assumptions and emissions reference values used
3. The methodology and data used are publicly available: Methodology (Y or N), Data (Y or N)

Focus on Embodied Emissions:

1. Sources of GHG emissions embodied in inputs accounted for:

Emissions embodied in the manufacture of farm/forestry machinery

Emissions embodied in buildings

Emissions embodied in the manufacture of fertilizer inputs.

Emissions embodied in the manufacture of pesticide inputs

Emissions embodied in purchased energy:

electricity

transport fuels

other (e.g., fuel for heat)

Emissions embodied in seed production

Other (please specify)

2. For all checked, clarify assumptions
3. The methodology and data used are publicly available: Methodology (Y or N), Data (Y or N)

Step 5: Transport of Biomass

Step 5: Transport of biomass

Biomass is transported from farm/plantation/forest to processing plant (Y or N)

If yes:

1. ___ The biomass transported in a different commodity type.
 - 1a. ___ A description of intermediate processing steps is available.
 - 1b. ___ Emissions associated with intermediate processing are accounted for (including, e.g., electricity used for processing).
2. ___ There is a multi-stage transport chain (e.g. truck to ship to truck or train).
 - 2a. List all stages in the transport chain.
 - 2b. Specify the stages for which emissions are accounted.
3. Transport from production site to use/processing plant is dedicated to this purpose (Y or N)

If Yes:

 - 3a. ___ All transport emissions are included

If No:

 - 3b. ___ A portion of transport emissions are allocated, and the allocation methodology is described.
4. ___ Return run of transport equipment is accounted for.
 - 4a. During the return run, transport equipment is:
___ empty ___ otherwise utilized
5. For relevant sections, clarify assumptions

Step 6: Processing into Fuel

Step 6: Processing into fuel

The biomass requires processing to produce fuel (Y or N)

1. ___ GHG emissions associated with material inputs used in the conversion process (e.g. chemicals, water) are accounted for.
2. ___ GHG emissions associated with energy used in conversion process are accounted for.
 - 2a. Specify the method used to account for grid-related emissions (e.g.average/marginal, national/regional, actual/future): _____
3. ___ GHG emissions from wastes and leakages (including waste disposal) are accounted for.
4. ___ Other GHG emissions from the process are accounted for.
 - 4a. List which ones: ___
5. ___ GHG emissions associated with the plant construction are accounted for.
 - 5a. Estimates of emissions associated with plant construction have been pro-rated to account for:
 - ___ Other uses of the plant
 - ___ Design life of the plant
 - ___ Other parameters; specify which ones: _____
6. For relevant sections, clarify assumptions

Step 7: By-products and Co-products

Step 7: By-products and co-products

By-products or co-products are produced (Y or N)

1. By/Co-products from the biomass are accounted for.
2. By/Co-products from non-biomass feedstocks are accounted for.
3. Explain definition of by/co-products: _____
4. An allocation method is used (Y or N):
 - Allocation by mass
 - Allocation by energy content
Method to determine energy content: _____
 - Allocation by economic value
Method to determine economic value: _____
 - Other allocation method
Specify method: _____ Method to determine parameters needed: _____
5. A substitution method is used (Y or N)
Identify method used to determine the exact type of use/application of a co-product: _____
Identify method used to determine what product the co-product would substitute for and what the associated GHG emissions are for that product: _____
6. Another method or combination of methods is used (Y or N)
 - Specify method: _____
 - Method to determine parameters needed: _____
7. For relevant sections, clarify assumptions

Step 8: Transport of Fuel

Step 8: Transport of fuel

Fuel is transported from processing plant to use site (Y or N)

If yes:

(please consider all emissions, including, for example, CH₄ emissions from biogas equipment)

1. ___ The fuel transported in a different commodity type.
 - 1a. ___ A description of intermediate processing steps is available.
 - 1b. ___ Emissions associated with intermediate processing are accounted for (including, e.g., electricity used for processing).
2. ___ There is a multi-stage transport chain (e.g. truck to ship to truck or train).
 - 2a. List all stages in the transport chain.
 - 2b. Specify the stages for which emissions are accounted.
3. Transport from the processing plant to the use site is dedicated to this purpose. (Y or N)

If Yes:

 - 3a. ___ All transport emissions are accounted for.

If No:

 - 3b. ___ Transport emissions are pro-rated; methodology for pro-rating is described.
4. ___ Return run of transport equipment is accounted for.
 - 4a. During the return run, transport equipment is:
___ empty ___ otherwise utilized
5. For relevant sections, clarify assumptions

Step 9: Fuel Use

For solid biomass and liquid and gaseous fuels used in stationary applications:

1. Analysis addresses electricity and/or heat (thermal energy)? (Y or N)
 - 1a. Facility is a CHP plant? (Y or N)
 - 1b. Electric efficiency of the use process _____
 - 1c. Thermal efficiency of the use process _____
 - 1d. Electricity sent to a general grid (Y or N)
 - 1e. In case of CHP, indicate method used to account for electricity and heat (i.e., allocation, substitution, etc.), as in LCA Step 5.
2. Specific emissions are addressed by the usage (Y or N)
 - 2a. Identify conversion/combustion technology
3. The technique specifically causes significant non-CO₂ emissions of:
___ N₂O (e.g. CFB-type boilers)
___ CH₄, (e.g. low level technique or small-scale)
___ Other
 - 3a. Describe evidence to exclude the occurrence of such specific GHG emissions.
4. Biomass is tainted with fossil material (e.g. in case of waste sources) (Y or N)
 - 4a. If yes, provide analysis on degree of fossil content, if available
5. The analysis addresses a technology upgrade (e.g. pile burning to modern energy technology)
 - 5a. If yes, provide emissions data on the replaced way of biomass burning, if available.
6. For relevant sections, clarify assumptions

Step 9: Fuel Use

For transport fuels:

1. Miles (km) per energy unit are addressed (Y or N)

1a. Miles (km) per energy unit: _____

1b. Describe how energy efficiency is factored into fuel use analysis.

2. Tailpipe gas is addressed (Y or N). If yes, describe methodology:

e.g.: CO₂ emissions associated with combustion source and feedstock sink are netted out; CH₄ and N₂O emissions from combustion are included.

Step 10: Comparison With Replaced Fuel

Step 10: Comparison with replaced fuel

1. Identify Methodology for LCA of replaced fuel(s) / energy production system(s).
2. This methodology is publicly available (Y or N)
If yes, provide references
3. Gases covered:
CO₂ ___ CH₄ ___ N₂O ___ HFCs ___ PFCs ___ SF₆ ___ Other _____
Please report global warming potential used for each GHG covered.
4. An LCA is performed on the replaced fuel(s) / energy production system(s). (Y or N)
 - 4a. If yes, list any sources of inconsistency between LCA of biofuel and LCA of replaced fuels/systems.
 - 4b. If no, identify the system boundaries.
 - 4c. Indicate how direct and indirect land use change is addressed in the LCA of the replaced fuels/systems
5. Specify which sources of emissions embodied in infrastructure are accounted for and clarify assumptions.
 - ___ Emissions embodied in buildings and facilities
 - ___ Emissions embodied in transportation fleet and infrastructure
 - ___ Emissions embodied in the manufacture of machinery
 - ___ Other sources of emissions embodied in infrastructure (please specify)

Step 10: Comparison With Replaced Fuel

I. Biofuel is used to replace transport fossil fuel (for stationary use, skip to section II)

6. Relevant characteristics of crude:

6a. Type of crude:

- Conventional crude
- Canadian oil sands
- Canadian/Venezuelan heavy oil
- Other
- Not specified

6b. Origin of fuel (region, refinery, etc), if specified

6c. Other important fuel characteristics, if specified

6d. Applicability conditions of the replaced fuel characteristics

- The reference fuel is a world average
- The reference fuel applicable only to one region (specify region)
- Other applicability conditions apply (please specify)

7. Emissions prior to extraction/production are accounted for (Y or N)

7a. If yes, specify pre-production sources included (e.g., geophysics, prospecting) and geographic/temporal coverage of analysis.

7b. Explain method for applying pre-production emissions to per barrel calculations.

8. Emissions from extraction/production are accounted for (Y or N)

8a. Direct and embodied emissions in extraction/production accounted for:

- Fuel combustion from drilling
- Fugitive methane emissions from equipment
- Fuel combustion from turbines and compressors
- Transportation emissions from helicopters and supply vessels
- Use of electricity (e.g., gasoil or fuel oil generators)
- Use of chemical inputs
- Other

8b. Natural gas emissions accounted for:

- Emissions from flaring natural gas
- Emissions from combustion equipment (specify gases included)
- Emissions from reinjection of natural gas
- Emissions from direct use of natural gas
- Emissions from other processing of natural gas
- Emissions from gas processing point to remove liquids
- Emissions from extracted liquids
- Emissions from electricity production

8c. Describe method for allocating emissions between crude oil and natural gas production

8d. Emissions for other extraction/production by/co-products are accounted for (Y or N)

• If yes, describe methodologies for calculating emissions and for allocating emissions between crude and by/co-products.

9. Crude is transported to the refinery (Y or N)

9a. Specify transport distance and mode(s) of transport (pipeline, tanker, etc.).

9b. For internationally transported crude, specify whether domestic, international, or total transport emissions are accounted for.

• Describe use of country-specific parameters in calculating transport emissions.

9c. Fugitive emissions during transport are accounted for (Y or N)

9d. Return journeys of transport fleet are accounted for (Y or N)

9e. The production/transport system involves liquified natural gas (Y or N)

9f. Emissions from the regasification plant are accounted for (Y or N)

10. Refinery emissions are accounted for (Y or N)

10a. Describe assumptions on refinery characteristics (e.g., existing, typical, local average)

10b. Describe method for calculating direct refinery emissions

10c. Emissions embodied in chemicals (catalysts, solvents, etc.) are accounted for (Y or N)

• If yes, describe method.

10d. Fugitive emissions accounted for (Y or N)

• If yes, describe method.

10e. Emissions for hydrogen production are accounted for (Y or N)

• If yes, specify the production process.

10f. Emissions for purchased and generated electricity are accounted for (Y or N)

• If yes, specify electricity mix of the purchased electricity

10g. Emissions from wastes and leakages are accounted for (Y or N)

• If yes, describe method

28

10h. Emissions for refinery by-products and co-products are accounted for (Y or N)

• If yes, describe methodologies for calculating emissions and for allocating emissions between fuel and by/co-products.

11. Fuel is transported or distributed prior to use (Y or N)

11a. Specify transport distance and mode(s) of transport (truck, tanker, etc.).

11b. For internationally transported fuels, specify whether domestic, international, or total transport emissions are accounted for.

• Describe use of country-specific parameters in calculating transport emissions.

11c. Fugitive emissions during transport are accounted for (Y or N)

11d. Return journeys of transport fleet are accounted for (Y or N)

12. Fuel use emissions are accounted for (Y or N)

(please consider consistency with Step 9)

If no:

12a: Please explain how equivalency with the biofuel system is defined (e.g. lower heating value)

If yes:

12b: Please explain how equivalency with the biofuel system is defined.

Do you refer to energy content of the fuel ____

Do you refer to Miles (km) per energy unit ____

12c: Describe how energy efficiency is factored into fuel use analysis.

12d: Tailpipe gas is addressed (Y or N). If yes, describe methodology.

13. Please identify any elements of the fossil fuel LCA not included in the above questions and describe methodology used to calculate emissions.

Step 10: Comparison With Replaced Fuel

II. Stationary use of biofuel for electricity/heat

7. Describe technologies, methodologies and data for calculating the extraction/production/transport of replaced energy source, using Transport Fuel questions 6-11, above, as guidance where appropriate.

8. Fuel use emissions are accounted (Y/N)

(please consider consistency with Step 9)

If no:

8a: Please explain how equivalency with the biofuel system is defined (e.g. lower heating value of utilized fuel)

8b: What type of fossil fuel is assumed to be replaced by the biofuel system?

Explain the assumption.

If yes:

8c: Please explain how equivalency with the biofuel system is defined.

Do you refer to energy content of the fuel (Y/N)

Do you refer to useful energy taking end use efficiency into account (Y/N)

If yes:

8d: Which method is used to define the production of replaced electricity/heat?

national average mix

marginal production

other _____

please explain your choice and assumptions.

8e: Report energy efficiency for electricity generation, and/or heat generation and describe how it is used in emissions analysis.

8f: Describe methodology for calculating evaporative emissions.

8g: Describe conversion/combustion technologies and method for calculating associated emissions, including trace gases.

9. Please identify any elements of the fossil fuel LCA not included in the above questions and describe methodology used to calculate emissions.

Status of the Framework

- The GBEP Steering Committee approved *Version Zero* for approval on 14 May, 2009.
- The UN Foundation and Italian Ministry for the Environment, Land & Sea provided for publication of the report.

**THE GBEP COMMON METHODOLOGICAL
FRAMEWORK FOR GHG LIFECYCLE
ANALYSIS OF BIOENERGY**

VERSION ZERO

Status of the Framework

- The Framework is also available online, as a downloadable Word document and an interactive website.

The screenshot shows the GBEP website interface. At the top, the GBEP logo is displayed with the tagline "Global Bioenergy Partnership" and "WORKING TOGETHER FOR SUSTAINABLE DEVELOPMENT". Below the logo is a navigation menu with links: "About GBEP", "Partners", "Programme of Work", "Bioenergy Info", "Events", "News", "Links", "Login", "FAQs", and "Contact Us". The main content area features the title "The Global Bioenergy Partnership Common Methodological Framework for GHG Lifecycle Analysis of Bioenergy". Below the title, a paragraph states: "This on-line questionnaire can be completed in multiple sessions. You can start filling in the information, submit and then re-access at a later time without losing previously entered data." There are two input fields: "Name and Surname: *" and "email address: *". Below these fields, the section "Step 1: GHGs covered" is displayed. The text reads: "The user is asked to provide Global Warming Potential values and/or a clear reference (e.g., "IPCC SAR values") for the GHGs included in the analysis. This is necessary to ensure consistency between reports and the repeatability of reported calculations." A list of checkboxes follows: CO2, CH4, N2O, HFCs, PFCs, SF6, and Other: [input field].

The Global Bioenergy Partnership Common Methodological Framework for GHG Lifecycle Analysis of Bioenergy

This on-line questionnaire can be completed in multiple sessions. You can start filling in the information, submit and then re-access at a later time without losing previously entered data.

Name and Surname: *

email address: *

Step 1: GHGs covered

The user is asked to provide Global Warming Potential values and/or a clear reference (e.g., "IPCC SAR values") for the GHGs included in the analysis. This is necessary to ensure consistency between reports and the repeatability of reported calculations.

CO2
 CH4
 N2O
 HFCs
 PFCs
 SF6
 Other:

Status of the Framework

- The Framework is undergoing initial testing by Partners and other interested organizations.

Step 1: GHGs Covered	FRANCE	ITALY	GERMANY	IFEU	PRIVATE COMPANY 1 (M&G)
CO ₂ ___	X	X	X	X	X
CH ₄ ___	X	X	X	Yes - differentiation made betw. fossil: (21) and non - fossil CH4 (18.25) (values acc. to Kyoto - Prot.)	X
N ₂ O ___	X	X	X	Yes - (310) (value acc. to Kyoto - Prot.)	X
HFCs					
PFCs					
SF ₆ ___					
Other					
Please report global warming potential used for each GHG covered.	CO2: 1, CH4: 23, N2O : 296	CO2: 1, CH4: 23, N2O : 296	CO2: 1, CH4: 23, N2O : 296	CO2: 1, CH4: 21/18.25, N2O : 310	CO2: 1, CH4: 25, N2O : 298
Step 2: Source of biomass					
Non-waste		X			X
Identify Feedstock:	ENERGY CROPS				ARUNDO DONAX
Residue or Other Waste		X	X		
Identify Feedstock:	TALLOW AND USED VEGETABLE OILS				
* Please explain definition of waste:					
Substance that the holder intended to discard	USED VEGETABLE OILS			Taken into account (basic but a mandatory criterion)	
Substance that had zero or negative economic value				Taken into account (not a basic criterion)	
Substance for which the use was uncertain				Taken into account (if really uncertain, in doubt a waste)	
Substance that was not deliberately produced and not ready for use without further processing	tallow (not sanitary discarded : C3)			Taken into account (basic but a mandatory criterion)	
Substance that could have adversely affected the environment	tallow (sanitary discarded : C1 and C2)			Taken into account (only if utilization is uncertain to avoid any harm)	

Preliminary Feedback

- GHG benefits due to direct land use change
- Yield improvements / intensification relevant to indirect land use change
- Boundary conditions
- Land use impacts of co-products
- Greater description of processing technology
- Options for reporting sensitivity analyses.

Next Steps

- Continued tests of Version Zero by Partners and other organizations
- Create an inventory of LCA methodologies offered by users of the Framework
- Solicit further stakeholder feedback
- In Spring 2010, reconvene the Taskforce to:
 - Decide on an optimal structure for the inventory of methodologies
 - Consider updates and revisions in response to user comments
