

WG1: Conceptual development of SDG-GSI interlinkages and tradeoffs

- **Brief input from Tina Beuchelt, ZEF:**
Center for Development Research at Bonn University project to include food security in biomass certification. Review of global studies on bioenergy potential indicated lack of consistency, possibly low overall potential. Call for **better representation of food security** in modeling (and indicators)
- **Brief input from Michael Brüntrup, GDI-DIE**
First, made a “plea” to consider sustainable charcoal! Second, he presented a SDG tradeoff tool (focusing on SDG 2), approach meant to support policy/decision makers in understanding SDGs

Discussion points:

- How to take into account **imports** (and exports)? SDG-12 is consumption-based, but does not include energy...internal GBEP discussion with different positions, reflecting concerns regarding **trade** → will be discussed further as “cross-cutting” issue
- How to consider “**best practices**” (e.g. certification) as possible proxies for indicators? May be helpful on the economic operator/project level, and could be aggregated to reflect national situation
